**Note:** The department recommends a review of progress and planned registration with a faculty advisor by the end of the first week of classes in the first semester or term at BYU and in the semester when 30, 60, and 90 hours are completed. Call 422-6269 or come to C104 BNSN to schedule an appointment. New incoming students should attend the chemistry and biochemistry session during New Student Orientation, where they can meet with a faculty advisor and review their planned registration.

Note: Students are encouraged to complete an average of 15 credit hours each semester or 30 credit hours each year, which could include spring and/or summer terms. Taking fewer credits substantially increases the cost and the number of semesters to graduate.

German, Japanese, and Russian), biological sciences, computer science,
engineering, mathematics, physics, statistics.

THE DISCIPLINE:
The Chemistry Bachelor of Science degree is the preferred
degree for chemistry majors (approved by the American
Chemical Society) especially those who desire an advanced degree (MS or PhD) in
chemistry. It also provides excellent preparation for those
individuals in preprofessional programs (e.g., medicine,
dentistry, business administration, or law).
Chemists and biochemists study the fundamental processes
that govern the natural world, including atomic structure and how atoms interact to form molecules and materials. They
study the mechanisms of chemical processes, including those
that underpin living systems such as the transfer of information
from DNA to RNA to proteins. They work to develop simplifying
models (theories) that permit the correlation and explanation of observations about the behavior of life to the structure of
rocks and minerals.
Chemistry and biochemistry provide an essential foundation for
the medical sciences, engineering (especially chemical
ingineering), electronics, energy, environmental sciences,
materials science, pharmacy, and virtually all manufacturing
processes. Chemistry and biochemistry are active branches of science that
are vital to human existence. Inasmuch as the field embraces
all aspects of the material world, it is subdivided into five areas of interest. Examples of these diverse areas include the
regulation of protein synthesis, cellular signal transduction at
the molecular level and proteomics (biochemistry), design and synthesis of medicinal compounds, catalysts and polymers
(organic chemistry), design and synthesis of new molecular
structures and materials (inorganic chemistry), spectroscopic
study of energy transfer and molecular structures (physical
chemistry), and analysis of medicinal compounds, biological
materials, and contaminants or trace elements found in the
environment (analytical chemistry).
Chemistry and biochemistry involve far more than test tubes
and beakers. They include sophisticated methodologies such as
recombinant DNA technology, working with a variety of
instruments such as mass spectrometers, calorimeters,
chromatographs, ultracentrifuges, lasers, X-ray diffractometers,
electron microscopes and nuclear magnetic resonance
spectrometers, all of which are used by undergraduate
chemistry and biochemistry students at BYU. Computers also
play an important role in these disciplines, with applications
ranging from simulation of molecules and their interactions to
the collection and analysis of data. The chemistry and
biochemistry curricula are both rigorous and intellectually
rewarding.

CAREER OPPORTUNITIES:
Graduates in chemistry and biochemistry obtain positions in
education and many different industries, performing analysis,
synthesis, characterization, observation, and modeling. Those
who work hard, are creative, and have intellectual curiosity are
in particular demand. The discipline also provides an excellent
preprofessional course of study for those interested in medicine, dentistry, law, and business.
